SICOT Events

34th SICOT Orthopaedic World Congress (Hyderabad OWC 2013)
17-19 October 2013 * Hyderabad, India

SICOT thanks all delegates for their participation in the Congress!

Awards

Congratulations to all awardees who were granted a prize at the Congress. A full list of winners can be found here.

SICOT Diploma Examination

SICOT also congratulates the 33 successful candidates of the eleventh Diploma Examination held on 15 and 16 October:

- Anuj Chawla
- Jay Deep Ghosh
- Paritosh Gogna
- Arvind Prasad Gupta
- Chintan Hegde
- Rajeev Hingorani
- Mamoon Abdulmunim Ibrahim
- Renjit Thomas Issac
- Prajyot Jagtap
- Ashish Jain
- Anand Kumaroth Somasundaram
- Manish Ladhania
- Sandeshkumar Lakkol
- Musa Muhammad
- Deepak Kumar Mulimani
- Sagar Narang
- Andre Georges Nguene Nyemb
- Rabea Odeh
- Ajibola Oladiran
- Temiloluwa Olufemi
- Harish Paivai
- Anil Patil
- Kedar Phadke
- Ramakanth Rajagopalakrishnan
- Ravi Ranjan Rai
- Vishal Rajput
- Ratnav Ratan
- Siddharta Sharma
- Jaswinder Singh
- Prasad Soraganvi
- Karadi Hari Sunil Kumar
- Vipul Vijay
- Shah Waliullah Wali

Rajeev Hingorani and Sagar Narang were granted the German SICOT Fellowships, which offer them the opportunity to visit well-known German orthopaedic centres for a period of four weeks. The fellowship is kindly provided by the German Section of SICOT.

Social Programme

The Opening Ceremony featured a speech by Subroto Bagchi on “Scaling the Self” and a dance
performance by the Ananda Shankar Jayant group. The **Indian Night Party** was held at the N Convention and included a memorable performance by the Bollywood dance group, "Unique Dance Troupe". All photos are available [here](#).

- **Sports Programme**

  We thank all those who joined the **Charity Run/Walk** in the early morning of 19 October and helped support a local children's charity. The **Cricket Match** between India XI and Rest of the World XI on 16 October was won by India. Photos of these events can be found [here](#).

XXVI SICOT Triennial World Congress combined with 46th SBOT Annual Meeting  
Rio de Janeiro TWC 2014  
19-22 November 2014 * Rio de Janeiro, Brazil

Abstract submission and congress registration will open soon on the [SICOT website](#)!
**Purpose** Hip prostheses with metal-on-metal (MoM) coupling can release cobalt-chromium particles and ions. The aim of this work is to verify the correlation between particles in the synovial fluid and circulating ions.

**Methods** Forty patients were enrolled; particles from synovial fluid were analysed by SEM–EDX (Scanning Electron Microscopy-Energy Dispersion X-rays analysis) and levels of circulating Co and Cr were assayed by ICP-MS (inductively-coupled plasma mass spectrometry).

**Results** In 16 cases we did not find any particles in the synovial fluid and the Co level in whole blood was 0.05–4.42 ppb; in seven with few particles the blood level was 2.2–15.6 ppb; in six cases with several particles the level was 5.0–54.3 ppb; finally, in 11 cases we isolated not only Co-Cr particles, but also Cr particles with low or absent Co and in these patients the circulating level of Co was 23.8–109.6 ppb. Co in serum and Cr level both whole blood and serum have shown a similar trend to Co; the correlation between all these values and the corresponding particles is statistically significant in all cases.

**Conclusion** Co and Cr both in serum and whole blood represents a systemic representation of the particle release at local level and can therefore be used to confirm a diagnosis and monitor the wear process of MoM articular prostheses.

*International Orthopaedics (SICOT)*

Case of the Month

October 2013

Osteoid Osteoma with Double Nidus

Author: Mahmut Nedim Aytekin - Turkey
Edited by Bassel El-Osta

22-year-old male patient presented with pain below his right knee. The characteristic of the pain was dully. The pain increased at night and was relieved by aspirin or non-steroid anti-inflammatory drugs.

There was no abnormal finding during his physical examination and in his laboratory blood tests.

His anteroposterior knee X-ray was normal and lateral view of the knee X-ray showed a bone tumour on his proximal tibia (Figure 1).

What will be the first thought and how to proceed?

[Click here to read more...]
A further evaluation with CT scan was done (Figure 2).

What is the final diagnosis?

a. Osteochondroma
b. Osteomyelitis
c. Paget disease
d. Ewing Sarcoma
e. Osteosarcoma
Initial diagnosis was a tumour that looks like osteoid osteoma.

The diagnosis of osteoid osteoma was done by means of his history and radiological evaluation. The patient was operated. The nidus was taken out and curettage was done. Allograft was inserted to the cavity after cauterization of the cavity. Patient's pain was resolved just after the operation. Pathological evaluation of the material was taken out which verified the diagnosis.

Osteoid osteoma is a benign bone tumour, composed of a central zone named nidus which is an atypical bone completely enclosed within a well vascularized stroma and a peripheral sclerotic reaction zone (1). Its etiology is unknown.

Interestingly, the CT has highlighted an osteoid osteoma with a double nidus. One must be aware of these cases to avoid incomplete removal of the lesion (2,3).

Osteoid osteoma is usually seen in the second or third decades of life and approximately twice as many men as women are affected (4,5,6). The most common complaint of osteoid osteoma is pain, often described as being more severe at night. Pain is improved after aspirin treatment (4). Observing pain relief after aspirin can be used for diagnosis. In this case, we saw an interesting osteoid osteoma which shows double nidus on CT views. Careful and enough curettage should be done for this disease for successful treatment.

Fellowship News

- Brussels University/SICOT Fellowship

Every year FOSFOM-ULB (Bourse de soutien à la formation médicale de l'Université Libre de Bruxelles) offers trainees in medical specialties a one-year fellowship at a training hospital of Brussels University. The candidates are selected jointly by a Jury of Faculty Members of Brussels University and of local universities that have a convention with Brussels University. Read more...
It was just over 150 years ago that Elizabeth Blackwell, a determined young girl, became the first American woman to gain admission to medical school. She did so in spite of popular prevailing theories of those times which proclaimed that women seeking education in medicine would develop “monstrous brains and puny bodies and abnormally weak digestion”. When she entered the class on her first day a death-like stillness prevailed, as if each member had been stricken with paralysis. It is due to trail blazing women like these, who showed unflagging zest in the face of hostility, that we owe the numerous women in the medical profession. Today, women constitute around 50% of an average class in medical school. However, orthopaedics has the lowest percentage of women in a surgical specialty, with only 4.3% of board certified orthopaedic surgeons being female according to the United States data.

The history of world orthopaedics has been highlighted by the work of women. It was as early as 1924 when Maud Forrester Brown, Britain’s first woman orthopedician, started orthopaedic services in the south-west country at the Bath and Wessex Orthopaedic Hopital, under the guidance of Sir Robert Jones. She went on to establish a complete chain of children's orthopaedic clinics throughout Somerset, Wiltshire and Dorset. In spite of the ignorance she had to face, she brought boundless energy. Miss Forrester was a member, and later emeritus member, of SICOT. The Journal of Bone and Joint Surgery in 1970 carried an article on her “In Memoriam” marking her death at the age of 84. Ruth Jackson, on the other hand, was the first practising female orthopaedist in the United States. She discovered the rewards of orthopaedics while working with polio patients. In 1932, she opened her office in Dallas, Texas. The following year the American Academy of Orthopaedic Surgeons was founded. All who practised orthopaedics were allowed to join, except her. Undaunted, she took and passed the board exams, becoming the first woman admitted to AAOS. She went on to become an authority on cervical spinal injuries, on which she had extensive publications.

In spite of an illustrious history, few women have entered the field of orthopaedics. Limited exposure to musculoskeletal topics in medical school and lack of role models have been identified as contributory factors. A recently published article “A profile of female academic orthopaedic surgeons” in Current Orthopedic Practice (issue 6) of the year 2013 was based on a survey including questions on demographics, training and education, practice components, mentorship and career satisfaction. The study, including 164 female orthopaedic surgeons, revealed that having a mentor positively influenced their career choice. Potential barriers to academic advancement which were identified included gender stereotype, department politics, and guilt about family obligations or family expectations. The study also revealed that 62% of female faculty members had at least one child and 73% were married or in a domestic relationship. The study concluded that in spite of a high satisfaction rate with their career choices and despite all of their successes, barriers to female academic advancement are still perceived.

The stereotypical image of an orthopaedic surgeon as being burly, using brute force to manually cut into bones, is a thing of the past. Orthopaedics today is revolutionised with the use of power instruments and also boasts of delicate subspecialties. It is a field that requires manual dexterity and three dimensional visualisation. Having more women be a part of orthopaedics is in the best interest of the specialty itself. For any specialty to progress or discover new technologies, it is imperative that it attracts brilliant minds, be it a man or a woman. The hope for any specialty is to snap the best and the brightest. Hence it becomes important that women genuinely interested in pursuing orthopaedics should not be discouraged. Efforts must be taken to eliminate unintended barriers. At the same time, diversity in caregiving and changes in perspectives are ultimately beneficial to patients in general.

In the issues to come we interview leading women orthopaedists around the world, to dispel common myths of not having enough time to have a family and other lifestyle issues associated with orthopaedics in general. This will guide the young surgeons about the pros and cons of a rewarding career in this field.
Courses by SICOT Members

- Assiut Shoulder Arthroscopy Course

Surgeons with good knee arthroscopic skills wishing to start or already performing shoulder arthroscopy are invited to attend the Assiut Shoulder Arthroscopy Course in Assiut, Egypt, from 1 January to 3 January 2014. Places are limited to 20, so please book early. Read more...
